GUARANTEED ANALYSIS

Total Nitrogen (N).....7.0%
6.0% Water Soluble Nitrogen
1.0% Water Insoluble Nitrogen
Available Phosphate (P₂O₅) 6.0%
Soluble Potash (K₂O) 6.0%
Magnesium (Mg) 1.0%
Sulfur (S) 1.0%

DERIVED FROM: CORN STEEP LIQUOR, SOY PROTEIN HYDROLYSATE,
SEAWEED EXTRACT (Ascophyllum nodosum and Potassium Hydroxide*),
CALCIUM CARBONATE, MAGNESIUM SULFATE, COPPER SULFATE,
FERROUS SULFATE, MANGANESE SULFATE, ZINC SULFATE

*Potassium Hydroxide as an extractant

Compatibility: Supergrow is compatible with most fertilizers, plant nutrients and pest control products. For best results, it is recommended that a physical and plant compatibility test be conducted before use.

Storage: Store in a cool, dry place away from moisture. Tightly reseal opened bags or sacks.

Expiration: Official OrganicsRx products when stored correctly can be applied for up to 2 years from the purchase date.

Handling: Official OrganicsRx products are non-toxic and considered safe when in contact with skin. Wash exposed skin after prolonged handling with warm soapy water. May be harmful if swallowed. Not for human or pet consumption.

Manufactured in the USA
Guaranteed by: Official OrganicsRx
P.O. Box 7208 • Ann Arbor, Michigan 48107
www.organicsrx.com

Official OrganicsRx Supergrow fertilizer is a non-toxic, OMRI listed, dry water-soluble powder with no animal waste added. Our products are packed full of essential nutrients that helps support growing higher yields of vegetables, herbs, fruit, flowers, trees, turf and orchids. Designed as a one-step application for in-ground, container, drip, foliar spray, greenhouse and hydroponic growing.

Commercial Suggested Applications: We suggest a materials compatibility test determined from soil, plant tissue analysis or sap analysis per fertilizer program. **Instructions:** Measure desired amount of Supergrow water-soluble powder into vessel before adding water. Add water and agitate vigorously until powder is dissolved. The product will oxygenate for up to 1-2 minutes depending on method of mixing. For indoor and outdoor use year-round.

Home Garden & Greenhouse Suggested Applications: **Instructions:** Measure 2 teaspoons of Supergrow water-soluble powder per 1 gallon of water. Add water and agitate vigorously until powder is dissolved. The product will oxygenate for up to 1-2 minutes depending on method of mixing. We suggest feeding 1-2 x per week for optimal results. For indoor and outdoor use year-round.

For Hydroponic Vegetables & Fruit: We suggest a materials compatibility test determined from plant tissue analysis and based on the method of hydroponic growing. **Instructions:** Measure desired amount of Supergrow water-soluble powder, pour into reservoir and agitate until dissolved. The product will oxygenate for up to 1-2 minutes depending on method of mixing. The application of Supergrow fertilizer should be based on hydroponic growers' program.

☐ Net wt. 1.25 lb (0.56 kg)

☐ Net wt. 50 lb (22.68 kg)

☐ 1 pallet Net wt. 2,000 lb (907 kg)

☐ Net wt. _____ lb (_____ kg)

NOTICE OF WARRANTY — Official OrganicsRx warrants that the product conforms to its material descriptions as is reasonable for the purposes stated on the label when used in accordance with directions under normal conditions of use. Crop injury, ineffectiveness or other unintended consequences may result because of such factors as weather conditions, presence of other material or manner of use or application, all of which are beyond the control of Official OrganicsRx. In no case shall Official OrganicsRx be liable for consequential, special or indirect damages resulting from the use or handling of this product.

CAUTION: Avoid ingesting. Product is non-toxic and non-flammable. Will not damage soil, roots, plants or foliage if used as directed on label. The product is not designed for human consumption. NOTICE: Buyer assumes all responsibility for safety and use not in accordance with label directions.

Information regarding the contents and levels of metals in this product is available on the internet at <http://www.aapfco.org/metals.html>.

Introduction:

With the increased cost of fertilizers and new imposed regulations, growers are trying to find the most efficient fertilizers that are less susceptible to leaching and groundwater contamination. This study looked at the efficacy of OrganicRx Supergrow 7-6-6, a water-soluble plant-based, animal-free powder vs. CAN-17 synthetic fertilizer.

Objective:

The purpose of this trial was to compare Organic Rx Supergrow 7-6-6 vs. the industry standard CAN-17 synthetic fertilizer efficacy on strawberry plant growth, fruit productivity and post-harvest fruit quality.

Location: PSI Research Farm located at 342 Green Valley Road, Watsonville, CA 95076

Strawberry Variety: San Andreas

Materials & Methods:

Two treatments were established using a randomized complete block design (RCBD), with four replicate plots per treatment. Strawberry beds comprised of two plant lines measuring 48 inches center-to-center with standard polyethylene bed mulch and soil fumigation treatment with Chloropicrin + 1,3-dichloropropene at 42.6 gal/ac were used for this trial. Each replicate was comprised of a minimum of one 4 ft wide bed x 50 ft in length. A total of 8 beds were used for this trial. All bareroot plants used for this trial were selected for uniform crown and root system size. UC day-neutral San Andreas variety was used for this trial. Drip applications were applied using a 6.5 horsepower Honda® water pump injecting Supergrow 7-6-6 and CAN-17 into the drip tape. Soil moisture was monitored to assure even distribution in the soil profile.

Treatment Table: Yellow- Supergrow Blue - Can-17

Trt #	Product	Application Timing	Pre-plant application rate of Agriform 18-6-12 (lbs N/ac)	Post-plant application rate for Supergrow7-6-6 and CAN-17
1	Supergrow 7-6-6	Weekly applications: 4/4/22, 4/22/22, 4/28/22, 5/5/22, 5/13/22, 5/20/22, 5/26/22, 6/3/22, 6/10/22, 6/17/22, 6/23/22, 6/30/22, 7/8/22, 7/14/22, 7/21/22, 7/26/22, 8/5/22, 8/12/22, 8/18/22, 8/26/22, 9/2/22, 9/8/22, 9/16/22, 9/23/22	117	5.5 lbs. N/ac
2	CAN-17	As specified for Trt 1	117	5.5 lbs. N/ac

Table 1. Application rates and timing for each treatment.

Evaluations:

1. Marketable and cull fruit yield data were taken twice-weekly starting April through the end of September. Yield data was converted into crates/ac for each replicate. Data was collected using 40 plants pick station per replicate.
2. Post-harvest fruit quality was evaluated throughout the months of April through September. A single 1-pound clamshell of marketable fruit from each replicate plot was harvested and stored in a commercial cooler at 34°F for approximately 5 days; the fruit was then removed from the cooler and stored at ambient temperature for 24 hours. Post- harvest quality was assessed by evaluating and categorizing the number of fruits with slight, moderate, severe physical damage, and fungal (*Botrytis cinerea*) infection. All fruit observed having only slight or moderate physical damage were categorized as marketable.

- Plant growth / vigor assessment were evaluated using a scale of 1-10 with 1= very weak plant, and 10= excellent vigor. Evaluations were done monthly, beginning in April 2022.
- The incidence of diseased plants was evaluated from each replicate plot on a monthly basis, at the same time as the vigor evaluations. Plants expressing symptoms of soil borne fungal pathogen infection (Wilting, collapsing, suppressed growth), were counted and recorded.
- Petiole samples were collected and analyzed for nitrate concentration once per month, April 2022 and ending in September 2022. From each replicate plot 10 random medium-aged petioles were collected within 40-plant pick stations.

Treatment Table: **Yellow- Supergrow** **Blue - Can-17**

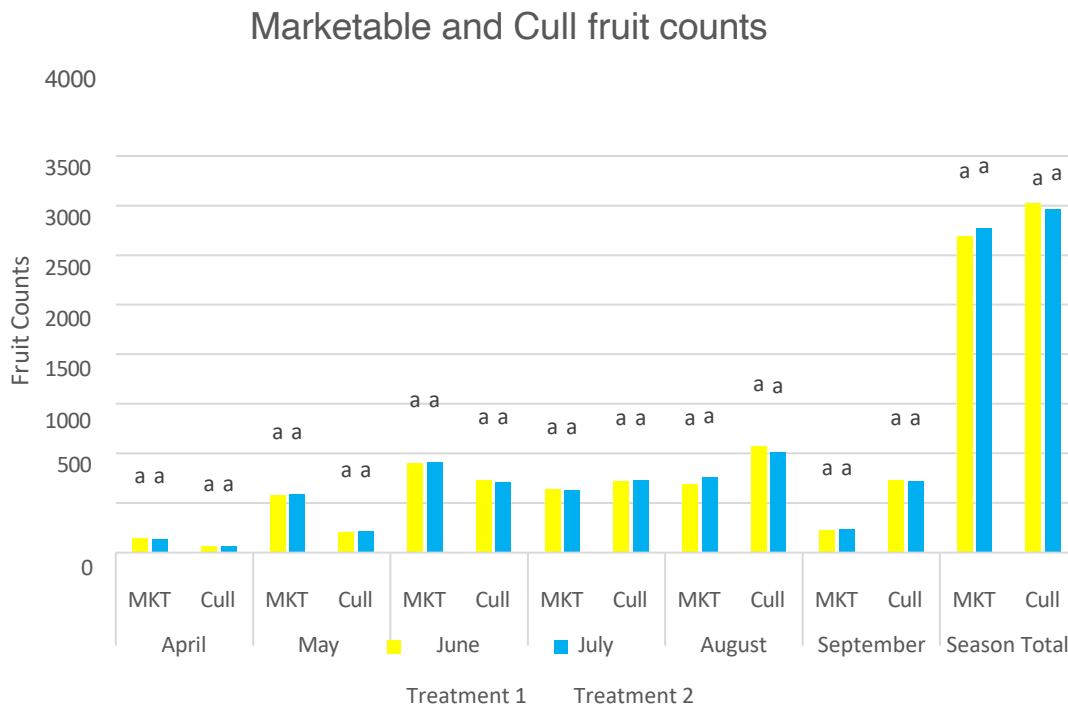

Figure 1. Marketable and Cull fruit counts for each month and season total

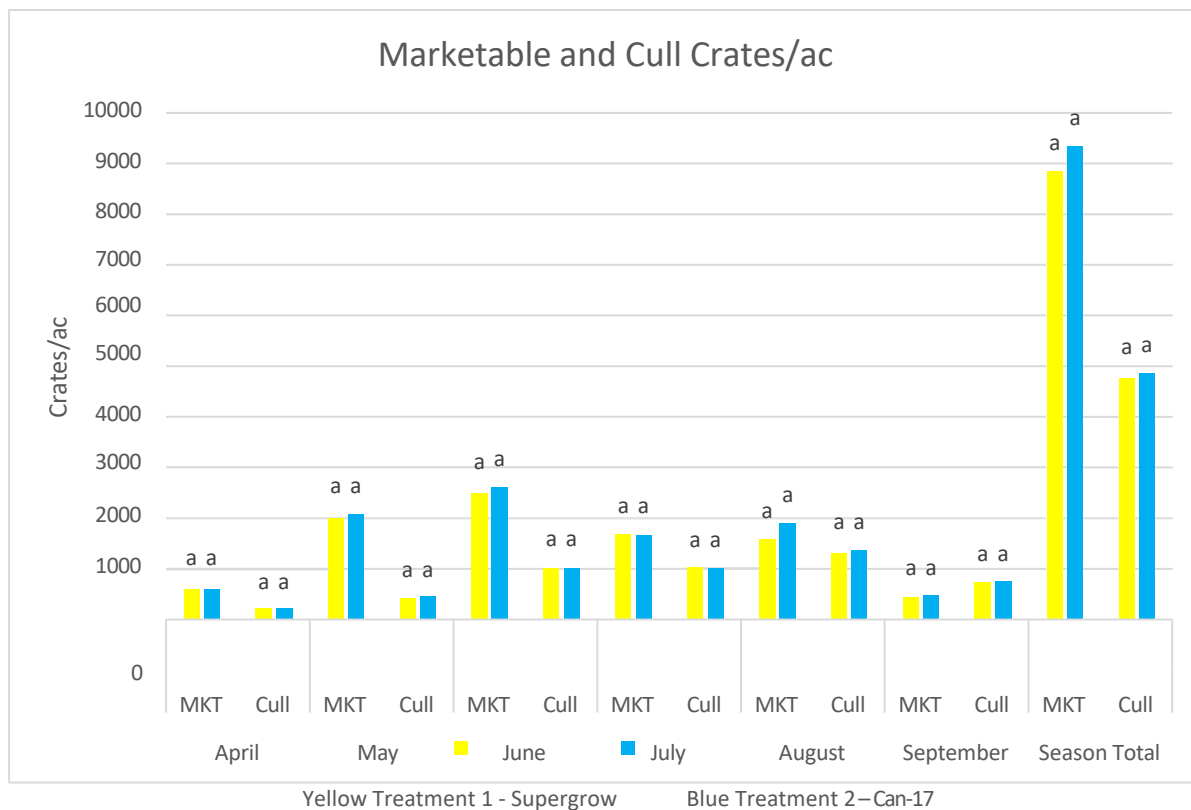

Figure 2. Monthly marketable and cull crates/ac and season total.

Yields shown above were calculated using plant density and berry weight data collected from the 40-plant pick station within each replicate plot; each bar is the mean of four replicates. Letters next to each treatment mean bar indicate statistically significant differences using *Duncan's MRT* ($p \leq 0.05$). Yield mean bars (within a month, or for the season total) followed by the same letters are not significantly different.

Figure 3. Percentage of marketable and cull fruit post-harvest.

The percentage of marketable fruit was calculated by adding the fruit in the categories slight and moderate and dividing by the entire number of berries in that clamshell. The percentage of cull was calculated by adding fruit in categories severe, rot, and Botrytis and dividing by the entire number of berries in the clamshell. Each bar is the mean of 4 replicates. Letters next to each treatment mean bar indicate statistically significant differences at a $p \leq 0.05$ probability level. Mean bars followed by the same letters are not significantly different.

Cull fruit data showed no statistical differences between treatments. Supergrow had slightly lower cull crates/ac than Can-17, but Supergrow had slightly higher cull fruit counts.

Holding test data showed no statistical differences between treatments.

Vigor rating analysis did not show statistically significant differences between treatments, but Supergrow showed higher vigor during the 6/28/22 and 7/22/22 evaluations.

Diseased plant evaluations did not show statistically significant differences between treatments, but Supergrow had numerically lower disease plant count throughout the trial except for the last evaluation (9/27/22). The pathogen that was diagnose on the San Andreas variety was *Macrophomina phaseolina*.

Petiole nitrate analysis data show no statistical analysis differences between treatments. Supergrow had a numerically higher nitrate at the 7/13/22_a evaluation.

Can-17 had numerically higher nitrates levels at all other evaluation time points. A good hypothesis why this occurred is because CAN-17 is a synthetic fertilizer which is readily available and quickly absorbed by the plant, whereas perhaps the organic fertilizer takes longer to break down and provide plant available nutrients. Towards the end of the trial, we noticed that plants from both treatments had bigger greener foliage and fruit compared to plants that were no treated with these two treatments.

Plant Sciences Trial Summary, 2023

"The Plant Sciences OrganicsRx Supergrow fertilizer trial on San Andreas strawberries in-field is encouraging. Our efficacy demonstrates that OrganicsRx Supergrow 7-6-6 water-soluble, plant-based fertilizer can perform on par with CAN-17 synthetic fertilizer. Yields, vigor, marketable cull and holding tests demonstrated OrganicsRx Supergrow performance on par with Can-17 synthetic."

All data in 2022 greenhouse trials yielded similar results as the in-field Supergrow / Can-17 trial applied on San Andreas strawberries.

- **Benefits:** OrganicsRx Supergrow 7-6-6 is less prone to leaching nitrogen below the root zone. All OrganicsRx products are free of all animal waste materials, which can help control pathogen and E-coli contamination in water supplies. Purchasing a water-soluble powder in bulk could reduce freight, liquid gassing and storage costs.
- *For more data, refer to Appendix B below.*

SUPERGROW

plant-based, animal free fertilizers for organic farming & gardening

JUST THE FACTS

- OMRI & CDFA certified
 - Water soluble powder.
 - Won't clog drip-lines and foliar
 - Slow-release Nitrogen over growing cycle
- Less prone to nitrate leaching below the root zone
 - Organic plant and mineral-based raw materials
 - Vegan. Contains no animal by-product or waste
 - Pathogen and E.coli free
- Non-toxic; won't burn or irritate skin or respiratory systems
 - Manufactured in the United States
 - 1 year shelf life when stored properly

Lettuce Trial

We were asked to do a small lettuce trial using a rate of 8.3 grams of Supergrow mixed in 1 gallon of water vs CAN-17 at 154.6 ml per 5 gallons of water. The only evaluation for this trial were vigor assessments.

Trt #	Product	Application Timing	Rate
1	Supergrow 6-1.5-2.5	Every 7 days	8.3 grams per 1 gal of water
2	CAN-17	Every 7 days	154.6 ml CAN-17 per 5 gal water; this solution is then siphon fertigated using 75 gal water/5 gal of fertilizer solution

Results:

Figure 6. Vigor data for lettuce trial.

Discussion:

Statistical analysis demonstrated that treatment 1 (Supergrow) was significantly higher than treatment 2 (CAN-17) in all vigor evaluations except for the Dec. 1st assessment. When observing the plants, we notice that treatment 1 had a slightly darker green color than treatment 2 which

meant that more chlorophyll was present also, we noticed that treatment 1 had slightly longer foliage than treatment 2 (Appendix A lettuce photos). In the future I recommend doing yield data to see if the Supergrow product performs better than CAN-17. Growers want to maximize the yield per acreage so, providing yield data will provide concrete data that this product has potential to compete with other products.

Conclusion:

Based on the data from this trial Trt 3 (Supergrow at 8.3g) performed the best in the vigor evaluation and it also had a good performance in number of inflorescences. Tissue analysis showed that Trt 3 and 4 (CAN-17) had the highest nitrogen percentage but since this data was not statistically analyze we cannot tell if these differences are significant. For future recommendation yield data should be collected to provide an insight whether the Supergrow fertilizer outperforms CAN-17. Same conclusion can be concluded for the lettuce trial; more data needs to be collected to have a better understanding if Supergrow fertilizer is effective in the leafy greens and strawberry industry.
